

## Masonry Heaters

**Masonry Heaters** are the most efficient and cleanest way to use wood to heat an energy efficient home. Masonry heaters store all the heat energy created from a single 60 to 90 minute, 2000F wood-firing and then slowly release all this stored heat energy over a 12 to 48 hour period depending on the masonry heater design. Masonry Heaters can also provide a heated bench seat and black or white food baking ovens. And at 2000F, there is no significant ash or creosote created.

We endorse and highly recommend Norbert Senf's Heat-Kit masonry heater, Jeremiah Church's Boreal Heat LLC and the international Masonry Heater Association:

Our own personal Masonry Heater (shown in the above/below photos) which we designed to have a 48 hour heat release time, heated bench seat and white baking oven that can reach 800F, and the **Masonry Heater Performance Calculator** which we developed are featured in the above Masonry Heater Association News website. Complete construction photos of our remote southern Oregon Garage/Shop/Guest Quarters and our Residence which has our Masonry Heater may be found here:
