

NextGen Boiler

Our Personal NextGen Boiler

The NextGen Boiler is a plug and play electric hydronic radiant heat appliance that enables the homeowner to have an affordable, easy and professional installation.

The NextGen Boiler replaces the complexity and expense of needing separate electrician/plumber installed boilers and hydronic radiant heat control panels. The NextGen Boiler includes a three stage modulating electric boiler, controller (with BTU/hour, flow rate, pressure, and supply/return temperature indicators), expansion tank, three speed selectable circulating pump, air vent, safety relief valve, supply/return differential pressure bypass valve, off peak power control, and outdoor temperature compensation. The NextGen Boiler also exercises the circulating pump for 15 minutes each day during the non-heating seasons to ensure the circulating pump will not seize up from extended non-use.

Hydronic radiant floor heat has never been more affordable for the homeowner and easier for the installer. We endorse and highly recommend:
